

IG, TR and IgSF, MHC and MhcSF: what do we learn from the IMGT Collier de Perles?

- IMGT®, the international ImMunoGeneTics information system®, <http://imgt.cines.fr>, is a high-quality integrated knowledge resource, specialized in the immunoglobulins (IG), T cell receptors (TR), major histocompatibility complex (MHC), and related proteins of the immune system (RPI) belonging to the IgSF and MhcSF.
- The data coherence in IMGT is based on IMGT-ONTOLOGY, the first ontology in immunogenetics and immunoinformatics. One of the breakthrough was the implementation of the IMGT unique numbering for V-DOMAIN and C-DOMAIN (IG and TR) and for G-DOMAIN (MHC), based on the IMGT-ONTOLOGY concepts of numerotation.
- Standardized 2D graphical representations or IMGT Colliers de Perles have been extended to the V-LIKE-DOMAIN and C-LIKE-DOMAIN of the IgSF other than IG and TR, and to the G-LIKE-DOMAIN of the MhcSF other than MHC. IMGT Colliers de Perles are particularly useful for sequence-structure analysis, visualization and comparison of positions for mutations, polymorphisms, antibody engineering, antibody/antigen interactions and TR/pMHC contact analysis. They are crucial for the evolution study of the IgSF and MhcSF proteins.
